

# **Multicentric study on cancer risk among workers in the pulp and paper industry**

The final report of the Multicentric International Cohort Study of Workers in the Pulp and Paper Industry, concluded in March 2001, is available below.

The aim of the Multicentric International Cohort Study of Workers in the Pulp and Paper Industry was to investigate the mortality and cancer incidence in workers employed in the pulp and paper industry. The study includes a large population of workers employed in the pulp and paper industry in 15 countries (Brazil, Canada, Denmark, Finland, France, Italy, Japan, New Zealand, Norway, Poland, South Africa, Spain, Sweden, the United Kingdom and the United States) and benefited from the collaboration with IARC. Several manuscripts have been published from this research project and are listed below.

The PIs of this project were: A Andersen, B Andreassen Rix, A Bergeret, P Boffetta, LA Facchini, P Henneberger, T Kauppinen, D Kielkowski, R Kishi, M Kogevinas, P Jäppinen, N Pearce, B Persson, I Szadkowska-Stanczyk., K Teschke, P Wild  
E Pasqual, R Wedekind, M Schubauer-Berigan in collaboration with P Boffetta, M Kogevinas, P Henneberger, N Pearce, K Teschke, P Wild were involved in making this report available online.

## **Multicentric study on cancer risk among workers in the pulp and paper industry final report**

The final report of the Multicentric International Cohort Study of Workers in the Pulp and Paper Industry, concluded in March 2001, is now available here.

The aim of the Multicentric International Cohort Study of Workers in the Pulp and Paper Industry was to investigate the mortality and cancer incidence in workers employed in the pulp and paper industry. The study includes a large population of workers employed in the pulp and paper industry in 15 countries (Brazil, Canada, Denmark,

Finland, France, Italy, Japan, New Zealand, Norway, Poland, South Africa, Spain, Sweden, the United Kingdom and the United States) and benefited from the collaboration with IARC.

Several manuscripts have been published from this research project. One of these describes the development of the Pulp and Paper Department Exposure Matrix (PAPDEM), a matrix linking department of employment of cohort members to probability and level of exposure to 27 agents under investigation (Kauppinen et al., 1997). The exposure of workers included in the international pooled cohort in the Pulp and Paper Industry has also been described in other publications (Teschke et al., 1999, Kauppinen et al., 2002, Korhonen et al., 2004).

Additional publications from this research project include:

- Risk of lung and pleura cancer mortality associated with asbestos exposure in the pulp and paper industry (Carel et al., 2002)
- Risk of lung cancer mortality after exposure to Sulfur Dioxide in the pulp and paper industry (Lee et al., 2002)
- Risk of cancer mortality after exposure to organochloride compounds in the pulp and paper industry (McLean et al., 2006)

Below we describe the methodology used and the results obtained from this project.

## **2. METHODS and MATERIALS**

### Participants

The population under study are the workers employed for at least one year in pulp and paper companies from 15 countries (Brazil, Canada, Denmark, Finland, France, Italy, Japan, New Zealand, Norway, Poland, South Africa, Spain, Sweden, the United Kingdom and the United States). The number of participants in the database and in the analysis by sex and country is presented in Table 1.1. Out of the 125,828 workers in the database, workers employed less than one year or with incomplete data were excluded. A total of 103,773 participants were included in analysis. Norway provided the largest number of members (27%). Basic statistics on duration of employment (mean 14.2; range 1-75) and years of follow-up (mean 21.1; range 0-51) are presented in Table 1.2. Individuals were identified from factory records and were followed up for mortality from the year of starting of production that ranged among 1943 and 1985 to the mid-1990s (Table 1.3).

### Exposure assessment

The cornerstones of the assessment were industrial hygiene measurement data included in the international database (Kauppinen et al., 1997), information from detailed company questionnaires, and the experience of the assessment team. Over 31,000 measurement results on 246 chemical agents from 13 countries were available in the international database. Most of them were from the 1980s and the 1990s. The most frequently measured groups of agents were inorganic gases (sulphur dioxide, hydrogen sulphide, chlorine, carbon monoxide, etc.), organic compounds (dimethylsulphide, formaldehyde, paper dust, etc.), organic solvents (toluene, turpentine, methanol, etc.), mineral dusts ('total' dust, asbestos, silica, talc, etc.), metals (mercury, lead, welding fumes, etc.) and bioaerosols (fungal spores, bacteria, endotoxins, etc.). The company questionnaires addressed the current and historical use and occurrence of chemical agents or their surrogates and working conditions in mills. Relevant information was extracted from them, classified by department, agent, and mill, and entered in PAPDEM. A computerized database was designed and constructed to help this comprehensive assessment effort, and to document the grounds for the actual assessment. Although the assessment was preferably based on measurement data whenever possible, there were many mill-department-agent-period combinations where professional judgments of the assessment team was indispensable. The full list of the agents evaluated and additional details on the methodology used is reported elsewhere (Kauppinen et al., 2002)

The exposure characteristics of individual cohort members could not be based on their tasks or job titles because these were available only for a part of the pooled cohort available to IARC. The minimum descriptor of the occupational histories in the epidemiological study was the department. Each mill cohort contained workers from many departments which were coded by using a classification (96 categories) constructed for the present study. Examples of departments in pulp mills (52 categories) are 'wood treatment', 'sulphite pulp, digestion' and 'chlorine plant'. Examples of departments in recycling mills (8 categories) are 'recycling, deinking' and 'recycling, winding'. Examples of departments in paper or paperboard mills (10 categories) are 'stock preparation' and 'fine paper machine'. Examples of departments in paper product mills (12 categories) are 'paper bags and sacks' and 'off-machine coating of paper'. Examples of non-production departments in mills (12 categories) are 'maintenance, repair, cleaning', 'power plant' and 'construction'. The classification included also a code for 'other specified department' and 'unknown department' in any type of mill. The full list of department codes used in the analysis is reported in Annex 1.

The PAPDEM application allowed the assessors to provide different exposure assignments for different time periods if there was a good reason to believe that prevalence and/or level of exposure had changed over time. We described exposure by using both the prevalence of exposure and the level of exposure because often only a portion of workers in a department were exposed to an agent. The prevalence of exposure (P) referred to the proportion (classified) of workers of the department exposed to the agent on an average workday. The classes of P were the same for each agent assessed in quantitative terms:

- 0 = no exposure (< 5% of workers in the department exposed)
- 1 = low prevalence of exposure (5-50%)
- 2 = medium prevalence of exposure (51-95%)
- 3 = high prevalence of exposure (>95%)
- 8 = potential exposure of unknown prevalence (prevalence class 1, 2 or 3)
- 9 = unknown prevalence of exposure (prevalence class 0, 1, 2 or 3)

The level of exposure (L) referred to the mean level (classified) of exposure at work averaged over the work-year among the exposed workers of the department. The agent-specific class limits were determined by using as guidelines percentile values of the results of the measurement database. The classes of L were:

- 0 = no exposure (level not higher than nonoccupational background)
- 1 = low level of exposure
- 2 = medium level of exposure
- 3 = high level of exposure
- 8 = potential exposure of unknown level (level class 1, 2 or 3)
- 9 = unknown level of exposure (level class 0, 1, 2 or 3)

The following 18 combinations of P and L were considered acceptable: 00, 99 and any combination of 1, 2, 3 and 8. When the prevalence and level of exposure are multiplied, the product represents the mean level of exposure for that group of workers.

PAPDEM includes a built-in reporting system with a large variety of listings and reports constructed to support the assessment effort and to provide documentation. PAPDEM is technically a MS Access 97 database which operates in MS Windows environment.

### Statistical analysis

For the purpose of epidemiologic analysis, participants were classified into these six department groups according to their department (Table 1.5, 1.6), only employed in one department (Table 1.7, 1.8) and their longest employment (Table 1.9).

Person-years at risk were calculated using a modified life-table approach (Coleman et al., 1986). Tabulation of person-years started at the beginning of the observation period or on day one of the second year of employment if this occurred after the start of the observation period. Expected deaths were computed by multiplying the person-years in each age- and five-year calendar period-specific stratum by the national reference rates. National rates were derived from the WHO Mortality Data base available at the time of the analysis (WHO 2001). The ratio of observed to expect deaths gives the standardized mortality ratio (SMR). A 95% confidence interval was computed for each SMR based on the assumption that the observed number of deaths followed a Poisson distribution.

Duration of employment was divided into seven categories (<4 years, 5-9, 10-14, 15-19, 20-24, 25-29, >30 years), and time since first employment (TSFE) was divided into five categories (<9 years, 10-14, 15-19, 20-24, >25 years). Table 1.10 reports total number of participants, person-years overall, and by countries, sex, and years since first employment. The SMR was calculated by dividing the observed number of deaths by the expected number of deaths and multiplying by 100.

Tests for linear trend in SMRs were done using a method described in Breslow and Day (1987). To test for interaction, TSFE, calendar time at hire, and age at hire were dichotomized, and the significance of the interaction of the dichotomized variable with the continuous exposure metric was tested.

### **3. RESULTS**

The results are presented in two sets of tables. Table set 2 includes the results of the mortality follow-up; table set 4 those of the cancer incidence follow-up. Within each set, results are presented by employment in the industry (tables sets 2.1-2.3 for mortality and 4.1-4.3 for incidence), by department of employment (table sets 2.4-2.9 for mortality) and by exposure to PAPDEM agents (table sets 2.10-2.15 for mortality and 4.4-4.5 for incidence). Results are presented for individual countries, as well as

for all countries combined. In tables 2.1-2.8 results are also presented for all countries excluding Brazil, because of the high proportion of loss to follow-up, and South Africa, because of the lack of reference rates.

### Outcome of the follow-up for mortality

The number of participants by follow-up status (alive, dead, lost to follow-up) by country and sex is presented in Table 1.4 (total cohort), Table 1.5 (by department group) and Table 1.6 (by department), Table 1.7 (employment in only one department group), Table 1.8 (employment in only one department), and Table 1.9 (by department group of longest employment). At the end of the follow-up, of the total 98,665 workers in the analysis excluding Brazil and South Africa, 77,256 (78%) were alive, 18,313 (19%) were deceased, 2,122 (2%) were lost to follow-up, and 974 (1%) had emigrated. Overall, the completeness of follow-up was 97% and was the largest in Poland (100%) followed by Denmark, Finland, France, Japan, and Norway (99%). Non-production departments included the largest number of participants (52%), followed by paperboard production (33%) and pulp production (21%).

### Overall mortality

A total of 18,522 deaths occurred during the study period, versus 20,267.4 expected yielding a SMR of 0.91 (95% CI, 0.90-0.93) (Table 2.1.1). The decrease was present in both genders (Table 2.1.2). Country specific SMR for all causes was above unity in Norway (SMR=1.02, 95% CI, 0.99-1.04) and Denmark (SMR=1.03, 95% CI, 0.99-1.06). In Brazil, the SMR was 0.35 (95% CI, 0.29-0.43) and we could not calculate the SMR in South Africa due to lack of information on national rates (Table 2.1.5 – 2.1.18). While a slightly reduced SMR for all cause of death might reflect a healthy worker effect, an important reduction might be due to incomplete ascertainment of deaths. We therefore conducted a combined analysis on data from all countries but Brazil and South Africa (Table 2.1.3, 2.1.4). The SMR for overall mortality increased significantly with increasing time since first employment (Table 2.2.1 – 2.2.4), while highest in the category with shortest duration of employment (Table 2.3.1 – 2.3.4).

### Cancer mortality

The overall cancer mortality was significantly decreased in the whole cohort (SMR 0.93), based on 4506 observed and 4840.5 expected deaths (Table 2.1.1). The

decrease was significant in male workers ( $\text{SMR}=0.93$ ; 95% CI 0.90-0.96) but not in female workers ( $\text{SMR}=0.96$ ; 95% CI, 0.88-1.04). These values were almost the same when excluding data from Brazil and South Africa which were incomplete (Table 2.1.3, 2.1.4). SMRs by country ranged from 0.67 (Japan) to 1.02 (Norway). Among 15 countries, only 2 countries, Norway (1.02) and USA (1.01), showed non-significant elevated SMR (Table 2.1.5 – 2.1.18). The SMR for all cancer mortality significantly increased with latency (i.e., time since first employment) (Table 2.2.1 – 2.2.4) but decreased with duration of employment (Table 2.3.1 – 2.3.4). Only other/unknown department had significantly increased SMR (Table 2.5.1 – 2.6.4).

Mortality from specific cancers for the total cohort revealed a statistically significant excess risk for pleura cancer (36 cases,  $\text{SMR}=1.87$ ; 95% CI=1.31-2.58) and other male genital organs (13 cases,  $\text{SMR}=2.39$ ; 95% CI=1.27-4.09) (Table 2.1.1). In males, pleura (31 cases,  $\text{SMR}=1.70$ ; 95% CI=1.16-2.42) and other male genital organs were significantly increased (Table 2.1.1). In females, mortality from trachea, bronchus and lung cancer (72 cases,  $\text{SMR}=1.32$ ; 95% CI=1.03-1.66) and soft tissue sarcoma (7 cases,  $\text{SMR}=2.55$ ; 95% CI=1.03-5.25) as well as pleura cancer (5 cases,  $\text{SMR}=4.53$ ; 95% CI=1.47-10.6), were higher than expected (Table 2.1.1). On the contrary, all of non-malignant neoplasms and six malignant cancers (buccal pharynx, oesophagus, stomach, liver, bone, prostate) had significantly decreased SMR.

The mortality rates of all cause, stomach cancer and disease of circulatory system had increased trends with increasing years since first employment (Table 2.2.1-2.2.4). The risk of all cancers, trachea, bronchus, and lung and mental disorders significantly decreased with increasing years of employment (Table 2.3.1-2.3.4).

Tables 2.4 to 2.6 show mortality by ever-work in one department (Table 2.4), only one department (Table 2.5) and department of longest employment (Table 2.6) in male and female workers. The analysis showed a significant excess of mortality for trachea, bronchus and lung cancer ( $\text{SMR}=1.22$ ; 95% CI=1.03-1.44) in other/unknown department and pleura cancer in pulp production ( $\text{SMR}=2.39$ ; 95% CI=1.03-4.72) and non-production department ( $\text{SMR}=2.27$ ; 95% CI=1.34-3.58) by the longest employment department in the total cohort (Table 2.6.1). The risk of mortality was not significantly different among male and female workers.

In Table 2.7 and 2.8, we present the mortality from selected causes of death by latency and duration of employment in only one department. For all cancers there was no

significant association with latency and duration of employment. For lung cancer, a significant increased SMR was seen among female workers with more than 20 years of latency (table 2.7.4).

According to detailed cause of death tabulations by specific department of ever employment (Table 2.9.1 - 2.9.51), 2 pulp production departments (wood treatment, production of groundwood), 2 paperboard pulp production departments (stock preparation, paperboard machine), one paperboard product manufacture department (production of bags and sacks) and 4 non-production departments (storage loading transport, office, construction, engineering) had SMRs for all cancer below unity.

Table 2.10 and 2.11 report SMR for specific cause of death for those ever exposed or ever highly exposed to each specific agent, respectively. The SMRs for cancers of pleura and other male genital organ were increased for many agents. SMRs for several other cancers, including melanoma (brighteners), Hodgkin's disease (nonvolatile organochlorinated compound),, other respiratory organ (ICD9 164-165) (mercury compound) and corpus uteri (hydraine) were also increased among workers exposed to specific agents (Table 2.10). For those ever highly exposed to specific agents under study, increased SMRs were reported for lung (volatile organochloride compounds, sulfur dioxide), lung in women (talc), pleura (volatile organochloride compounds, oil and synthetic fluid with dermal absorption, non-chlorinated organic solvent, welding fumes), cervix uteri (inorganic chlorine compounds, titanium dioxide), liver (oil and synthetic fluids with inhalation exposure), ovary (talc) (Table 2.11). Table 2.12 and 2.13 reports SMRs for specific causes of deaths by years since first exposure and duration of employment, respectively. The SMRs for overall mortality and all cancer mortality increased with increasing latency in the majority of agents (Table 2.12), but they were highest in less than 10 years of duration of employment and decreased in later periods (Table 2.13). SMRs for selected causes of death by years of high-exposure work to each specific agent are reported in Table 2.14. Table 2.15 reports SMRs for selected causes of death by cumulative exposure to each specific agent. There were no significant trends for all cancer mortality analysed by cumulative exposure, except combustion products and talc exposure, which showed significantly decreased SMRs for all cancer mortality with increasing cumulative exposure (Table 2.15)

#### Outcome of the cancer incidence follow-up

For cancer incidence, 73,775 workers from 5 countries (Denmark, Finland, New Zealand, Norway, Sweden) could be followed (Table 3.1). Among them 51,797 (70%) were alive, 19,459 (26%) were deceased, 1,594 (2%) were lost to follow-up, and 925 (1%) had emigrated. Overall, the completeness of follow-up was 96% and all of countries were over 98%, except New Zealand (81%). Tables 3.2 and 3.3 report numbers of participants and person-years by time since first employment and duration of employment, respectively. Non-production departments included the largest number of participants (43%), followed by paperboard production (25%) and pulp production (19%) (Table 3.4). The follow up by only one department and department of longest employment were presented at tables 3.5 and 3.6.

### Cancer incidence

The overall cancer incidence was significantly decreased in the whole cohort (SIR 0.91 95% CI, 0.88-0.93), based on 5,920 observed and 6,527.4 expected incidence (Table 4.1.1). Cancers of oesophagus, stomach, large intestine and rectum, liver, prostate, testis, brain, thyroid and leukaemia contributed decreased overall cancer incidence. However, in women, the cancer incidence was increased for lung (SIR 1.32 95% CI 1.01-1.69), ovary (SIR 1.21 95%CI 0.95-1.52), cervix uteri (SIR 1.24 95% CI 0.99-1.52), or other female genital organs (ICD9 184) increased (SIR=1.95; 95% CI 1.01-3.41).

In all countries combined and in Finland, the SIR for overall cancer incidence increased with increasing time since first employment (Table 4.2). But there were decreasing trends for cancers of buccal pharynx and oesophagus and an increasing trend for melanoma with duration of employment (Table 4.3).

The cancer of ovary (formaldehyde), cervix uteri (dyes), lung (nonvolatile organochlorinated compound, dyes, inorganic chlorine compound, oil & synthetic fluid) were also increased among workers exposed to specific agents (Table 4.4).The SIR calculated for the ever highly exposed group was elevated for four cancers (ovarian cancer among exposed to talc and combustion products, lung and bone cancer among exposed to sulfur dioxide, breast cancer among exposed to dust) (Table 4.5).

| Years of employment and follow-up                                       | 1.2  |
| Dates of birth, employment and follow-up                                | 1.3  |
| Number of exposed subjects and person-years, total, by country, sex and |      |
| Vital status  | 1.4  |
| Department of ever employment (one digit code)                          | 1.5  |
| Department of ever employment (two digits code)                         | 1.6  |
| Employment in only one department (one digit code)                      | 1.7  |
| Employment in only one department (two digits code)                     | 1.8  |
| Department of longest employment  | 1.9  |
| Years since first employment  | 1.10 |
| Duration of employment  | 1.11 |

### **2 - MORTALITY - INDIRECT STANDARDISATION**

|   |                  |
|---|------------------|
| Detailed causes of death  | 2.1.1 - 2.1.18   |
| Selected causes by years since first employment                                       | 2.2.1 - 2.2.4    |
| Selected causes by duration of employment   | 2.3.1 - 2.3.4    |
| Selected causes by department of ever employment                                      | 2.4.1 - 2.4.24   |
| Selected causes by employment in only one department                                  | 2.5.1 - 2.5.4    |
| Selected causes by department of longest employment                                   | 2.6.1 - 2.6.4    |
| Selected causes by employment in only one department and years since first employment | 2.7.1 - 2.7.4    |
| Selected causes by employment in only one department and duration of employment       | 2.8.1 - 2.8.4    |
| Detailed causes by specific department of ever employment                             | 2.9.1 - 2.9.51   |
| Detailed causes by ever exposure to specific agent                                    | 2.10.1 - 2.10.27 |
| Detailed causes by ever high exposure to specific agent                               | 2.11.1 - 2.11.27 |
| Selected causes by years since first exposure to specific agent                       | 2.12.1 - 2.12.27 |
| Selected causes by duration of exposure to specific agent                             | 2.13.1 - 2.13.27 |
| Selected causes by duration of high exposure to specific agent                        | 2.14.1 - 2.14.19 |
| Selected causes by cumulative exposure to specific agent                              | 2.15.1 - 2.15.19 |

### **3 - INCIDENCE - DESCRIPTIVE TABLES**

|   |     |
|---|-----|
| Number of exposed subjects and person-years, total, by country, sex and |     |
| Vital status  | 3.1 |
| Years since first employment  | 3.2 |
| Duration of employment  | 3.3 |
| Department of ever employment (one digit code)                          | 3.4 |
| Employment in only one department (one digit code)                      | 3.5 |
| Department of longest employment  | 3.6 |

### **4 - INCIDENCE - INDIRECT STANDARDISATION**

|   |                |
|---|----------------|
| Detailed cancer sites   | 4.1.1 - 4.1.6  |
| Selected cancer sites by years since first employment         | 4.2.1 - 4.2.6  |
| Selected cancer sites by duration of employment               | 4.3.1 - 4.3.6  |
| Selected cancer sites by ever exposure to specific agent      | 4.4.1 - 4.4.27 |
| Selected cancer sites by ever high exposure to specific agent | 4.5.1 - 4.5.27 |
